

VEGETABLE CLASSIFICATION

Quite a large number of vegetable crops are grown in the country either on a commercial scale or limited to backyards of homesteads. A few crops have similarity while others have dissimilarity in their climatic and soil requirements, parts, used, method of cultivation etc. While describing individual vegetables, there is possibility of repetition in many aspects. In order to avoid repetition, it is essential to classify or group into different classes/groups. Different methods of classification followed in vegetables are described below:

Botanical classification

Botanical classification is based on taxonomical relationship among different vegetables. Plant kingdom is divided into four viz. Thallophyta, Bryophyta, Pteridophyta and Spermatophyte. All vegetables belong to division Angiospermae of Spermatophyta. It is further divided into two classes viz., Monocotyledoneae and dicotyledoneae.

The family wise distribution of vegetables under the classes is as follows:

Monocotyledoneae

Family -	Alliaceae	
	<i>Allium cepa</i>	Onion
	<i>Allium cepa</i> var. <i>Aggregatum</i>	Multiplier onion
	<i>Allium cepa</i> var. <i>Viviparum</i>	Top onion
	<i>Allium porrum</i>	Leek
	<i>Allium sativum</i>	Garlic
	<i>Allium fistulosum</i>	Welsh onion
	<i>Allium ascalonicum</i>	Shallot
	<i>Allium schoenoprasum</i>	Chive
Family -	Liliaceae	
	<i>Asparagus officinalis</i>	Asparagus
Family -	Araceae	
	<i>Dioscorea alata</i>	Larger yam
	<i>Dioscorea esculenta</i>	Lesser yam
	<i>Colocasia esculenta</i>	Taro
Family -	Poaceae (Graminae)	
	<i>Zea mays</i>	Sweet corn

Dicotyledoneae

Family -	Aizoaceae	
	<i>Tetragonia expansa</i>	New Zealand spinach

PDF BY:- Agrilearner App

Family -	Chenopodiaceae	
	<i>Beta vulgaris</i>	Beetroot and Palak
	<i>Beta vulgaris</i> var. <i>cicla</i>	Swiss chard
	<i>Spinacia oleracea</i>	Spinach
	<i>Artiplex hortensis</i>	Chakwat / orach
	<i>Chenopodium album</i>	Bathua
Family -	Asteraceae (Compositae)	
	<i>Cichorium intybus</i>	Chicory
	<i>Cichorium endivia</i>	Endive
	<i>Lactuca sativa</i>	Lettuce
	<i>Cynara scolimus</i>	Artichoke
Family -	Convolvulaceae	
	<i>Ipomoea batatas</i>	Sweet potato
Family -	Brassicaceae (Cruciferae)	
	<i>Brassica oleracea</i> var. <i>acephala</i>	Kale
	<i>Brassica oleracea</i> var. <i>gemmifera</i>	Brussels sprouts
	<i>Brassica oleracea</i> var. <i>capitata</i>	Cabbage
	<i>Brassica oleracea</i> var. <i>botrytis</i>	Cauliflower
	<i>Brassica oleracea</i> var. <i>italica</i>	Sprouting broccoli
	<i>Brassica caulorapa</i>	Kohlrabi or knol khol
	<i>Brassica napus</i> var. <i>napobrassica</i>	Rutabaga
	<i>Brassica campestris</i> var. <i>rapa</i>	Turnip
	<i>Brassica juncea</i>	Leaf mustard
	<i>Brassica chinensis</i> , <i>B. pekinensis</i>	Chinese cabbage
	<i>Armoracia rusticana</i>	Horse-radish
	<i>Raphanus sativus</i>	Radish
Family -	Cucurbitaceae	
	<i>Cucurbita pepo</i>	Summer squash
	<i>Cucurbita moschata</i>	Pumpkin
	<i>Cucurbita maxima</i>	Winter squash
	<i>Cucurbita lanatus</i>	Water melon
	<i>Cucumis melo</i>	Musk melon
	<i>Cucumis melo</i> var. <i>momordica</i>	Snap melon
	<i>Cucumis melo</i> var. <i>utilissimus</i>	Long melon

PDF BY:- Agrilearner App

	<i>Cucumis melo</i> var. <i>conomon</i>	Oriental picking melon
	<i>Cucumis sativus</i>	Cucumber
	<i>Praecitrullus fistulosus</i>	Tinda
	<i>Sechium edule</i>	Chow-Chow
	<i>Luffa acutangula</i>	Ridge gourd
	<i>Luffa cylindrica</i>	Sponge gourd
	<i>Lagenaria siceraria</i>	Bottle gourd
	<i>Trichosanthes dioica</i>	Pointed gourd / Parwal
	<i>Trichosanthes anguina</i>	Snake gourd
	<i>Momordica charantia</i>	Bitter gourd
	<i>Benincasa hispida</i>	Ash gourd
Family -	Euphorbiaceae	
	<i>Manihot esculenta</i>	Tapioca
Family -	Fabaceae (Leguminosae)	
	<i>Pisum sativum</i>	Peas
	<i>Phaseolus vulgaris</i>	French bean
	<i>Phaseolus lunatus</i>	Lima bean
	<i>Vicia faba</i>	Broad bean
	<i>Vigna unguiculata</i>	Cowpea
	<i>Cyamopsis tetragonoloba</i>	Cluster bean
	<i>Vigna unguicula</i> var. <i>sesquipedalis</i>	Asparagus bean
	<i>Lablab purpureas</i>	Lablab bean
	<i>Glycine max</i>	Soybean
	<i>Psophocarpus tetragonolobus</i>	Winged bean
	<i>Tigonella foenum graecum</i>	Methi / fenugreek
	<i>Tigonella corniculata</i>	Kasuri methi
Family -	Malvaceae	
	<i>Abelmoschus esculentus</i>	Okra / Bhendi
Family -	Solanaceae	
	<i>Solanum tuberosum</i>	Potato
	<i>Solanum melongena</i>	Brinjal
	<i>Solanum lycopersicum</i>	Tomato
	<i>Capsicum annuum</i>	Chilli
Family -	Apiaceae (Umbelliferae)	

<i>Daucus carota</i>	Carrot
<i>Petroselinum crispum</i>	Parsley
<i>Apium graveolens</i>	Celery
<i>Pastinaca sativa</i>	Parsnip

Cultural and climatic requirements of crops belonging to a family are not always similar. Cultural requirement of radish is entirely different from that of cabbage. Similarly climatic requirement of peas are different from that of cowpea.

Classification based on hardiness

This classification is based on ability to withstand frost and low temperature and it will be useful to know season of cultivation of a crop. Here the vegetable crops are classified into hardy, semi hardy and tender. Hardy vegetables tolerate frost and low temperature and are basically winter or cool season or temperate vegetables. Warm season or subtropical or tropical vegetables are considered as tender since they cannot withstand frost. Temperate vegetables, in general, can be stored for long periods under low temperature. Tropical vegetables are bulky and more perishable compared to temperate vegetables.

Hardy	Semi hardy	Tender
Asparagus	Carrot	Amaranth
Crucifers	Celery	Okra
Garlic	Beet root	Brinjal
Leek	Globe artichoke	Chilli
Onion	Lettuce	Cluster bean
Parsley	Palak	Cucurbits
Peas	Parsnip	Tomato
Radish	Potato	Colocasia
Rhubarb		Amorphophallus
Spinach		Yams
		Sweet potato

Classification based on parts used

In this system, crops are classified based on their parts used for vegetable purpose.

Tender stem and leaves	:	Cabbage, Chinese cabbage, knolkhol. Amaranth, palak etc.
Fruits	:	Tomato, brinjal, chilli, cowpea etc.
Flower parts	:	Sprouting broccoli

Under ground portion : Carrot, radish, beet root, potato etc.

The cultural requirements of crops in each group may not be same. For eg., cultural requirement of cowpea is different for that of tomato. Same is that of cabbage and palak.

Classification based on cultural requirement

This is the most convenient and widely used system of classification of vegetables. Vegetables having similar cultural requirements are grouped together and placed in one group. For eg., crops belonging to group Cucurbits are seed propagated, direct sown, trailing and vigorous growing, cross pollinated and the cultural practice are almost same.

1. Solanaceous fruit vegetables
2. Cucurbits
3. Peas and beans
4. Cole crops
5. Bulb crops
6. Root crops
7. Potato
8. Tuber crops
9. Okra
10. Pot herbs / greens
11. Salad crops
12. Perennial vegetables

Classification based on season of cultivation

This is one of the most important classifications from the grower's point of view since majority of vegetables are season bound and specific to particular seasons. Vegetables are classified into summer season crops, rainy season crops and winter season crops based on growth and production during particular seasons.

Spring / summer season prevails from February to June / July under North Indian plains and from January to May / June in South Indian plains. October to January is winter season, experiencing chilling temperature, in most parts of the country. However, in high rain warm humid climatic condition of Kerala, a distinct winter season is lacking and rainy season starts from June and extents up to September. Here vegetable crops can be grouped as rainy season, mild winter season, and summer season crops.

A few typical vegetables suited to each group are :

Winter season crops - Cruciferous vegetables, carrot, radish, beetroot, onion, garlic, peas etc.

PDF BY:- Agrilearner App

- Mild winter - Hyacinth bean, winged bean, tomato
- Summer season - All gourds, amaranth
- Rainy season crops - Bhendi, chilli, brinjal, cluster bean, cowpea etc.

However, depending on receipts of rain, slight variation is noticed in different parts of country. Usually early rains are received in Kerala where monsoon starts during last week of May or first week of June.

Vegetable crops can also be classified based on duration of crop growth and flowering (annual / biennial / perennial), ability to grow and set seeds under a particular climate (temperate / tropical / sub tropical), mode of pollination (Self pollinated (<5% cross pollination) / cross pollinated (>12% cross pollination) / often pollinated (5-12% cross pollination). pH requirement of soil etc.

None of above classifications, except botanical classification, is hard and fast since one and the same crop fall in different groups or can be accommodated in more than one class. For example, crops like brinjal and chilli are treated as rainy season crops and bitter gourd, snake gourd and cucumber as summer season crops. These vegetables can be successfully cultivated in other seasons as well, by taking adequate care. Varieties within a crop also exhibit variations in their response to season of cultivation, temperature requirement etc. In crops like cowpea, there are specific varieties suited to rainy season, summer season and winter season.

Each method of classification has its own relevance under specific situations and will be helpful to know the crop requirements by professionals, farmers and students.

1. Scientific method of classification
2. Hardy vegetables can tolerate
 - a. low temperature
 - b. high temperature
 - c. drought
 - d. high rainfall
3. Flowers as economical part in
 - a. sprouting broccoli
 - b. cabbage
 - c. palak
 - d. knol khol
4. Vegetables classification based on cultural requirement
5. Taro is
 - a. *Colocasia*
 - b. *Dioscorea*
 - c. *Amarphophallus*
 - d. *Xanthosoma*
